

Dog Kennel Hill Primary School - Science

Topic: Light

Year: 3

Strand: Physics

What should I already know?

- Some things produce **light**, such as lamps or candles.

What will I know by the end of the unit?

What is a **light source**?

- A **light source** is something that **emits light** by burning, electricity or **chemical reactions**.
- Burning **light sources** include the Sun, flames from a fire and stars.
- We must never look directly at the Sun as the **light** produced is very **bright** and can be harmful to our eyes. This is why we wear **sunglasses**.
- Electric lights** include lamps, car headlights and street **light**.
- Lights** that are caused by **chemical reactions** are much less common. This happens when different chemicals react and **light** is a **product** of that reaction. Examples can include glow sticks and fire flies.

Why do we need **light**?

- We need **light** so that we are able to see in the **dark**.
- This is because the **dark** is the absence of **light**. The Sun and stars always give us **light** but we can only see the stars when it is **dark**. At night time we cannot see the Sun's **light** as the Earth turns and our part of the Earth is not lit up by the Sun at night.
- When we are driving, we need car headlights or street **lights** to help us.
- If we are walking or out in the dark, we would need **torches** to help us see. You should not look directly into the **torch** as this is dan-

What are not **sources of light**?

- The Moon is not a **source of light** even though we can see it in the **dark**.
- This is because the Sun's **light reflects** on the **surface** of the Moon making it appear as though the Moon **emits light**.
- Shiny things are not **light sources** - they appear

How does **light** travel?

- Light** travels in straight lines.
- When **light** is blocked by an **opaque** object, a **dark shadow** is formed.

Diagrams

How are **shadows** formed?

Vocabulary

Angle	the direction from which you look at something
Bright	a colour that is strong and noticeable, and not dark
Chemical reactions	a process that involves changes in the structure of something
Dark	the absence of light
Dim	light that is not bright
Electricity	a form of energy that can be carried by wires and is used for heating and lighting, and to provide power for machines
Emits	to emit a sound or light means to produce it
Light	a brightness that lets you see things.
Mirror	a flat piece of glass which reflects light , so that when you look at it you can see yourself reflected in it
Opaque	if an object or substance is opaque , you cannot see through it
Product	something that is produced
Reflects	sent back from the surface and not pass through it
Shadows	a dark shape on a surface that is made when something stands between a light and the surface
Source	where something comes from
Sunglasses	glasses with dark lenses which you wear to protect your eyes from bright sunlight
Surface	the flat top part of it or the outside of it
Torches	a small electric light which is powered by batteries and which you can carry
Translucent	if a material is translucent , some light can pass through it
Transparent	If an object or substance is transparent , you can see through it

Key information

- When **light** is blocked by an **opaque** object, a **dark shadow** is formed. An **opaque** material blocks **light** so we can't see through it and shine a **light** through it.
- When **light** is shone onto a **transparent** object, the **light** travels through it, we can see through it and it makes a very faint **shadow**.
- When **light** is shone onto a **translucent** object, some of the **light** travels through it, we can see **bright light sources** through it and it makes a fairly **dark shadow**.
- The size of a **shadow** changes as the **light source** moves. The further away the **light source** is, the smaller the **shadow** is. The closer the **source** of the light, the bigger the shadow.
